One of the most useful features of AutoCAD is the ability to connect to drawings or other data that may be stored on another computer. This capability also comes in handy when one's drawings are sent to a publisher, or a job is outsourced. Connections are established using the Design Connection library (DCLIB) or Connection Manager. The DCLIB manages all the files needed to connect and communicate with a remote system. These files are stored on a server on the network in which the connection is made. The DCLIB is installed on the server, and the application is set up to access it. The Connection Manager is the middleman between the remote drawing and the client applications and is responsible for opening the Connection Manager Window, setting the connection parameters, saving the information to the DCLIB and closing the window. The DCLIB can also store the connection information on the client side for situations where the server is inaccessible. There are two types of connections, active and inactive. Active connections are used when the application connects to a server. Inactive connections are created when the client application, the server, or both disconnects from the connection and this disconnect is not expected to occur. Both the Design Connection and Connection Manager features are used to connect to remote systems, including AutoCAD Web Connections. The following table provides the basic instructions on setting up a connection. Set Up a Remote Connection to AutoCAD with the Design Connection Library To connect to AutoCAD using the Design Connection Library, the following steps must be followed: Launch the Design Connection library by pressing the "DCLIB" button on the tools toolbar. Select "Connect" from the menu bar. Enter the remote host name, user ID, and password. Select "OK" to connect. If connection does not take place, check that the remote host name is correct and that the remote user ID and password are correct. Note: Make sure that you are using a TCP/IP connection with a local area network (LAN). To determine whether your AutoCAD is connected to the Design Connection Library, check the following: Click the "Network" button on the tools toolbar. Click the "Device Manager" button. Select the "On-screen Display" tab. If the check box for "Design Connection Library" is selected, you are connected to the Design Connection Library. Select "On

Architecture AutoCAD Architecture by Autodesk Architecture and Building Systems is a product created for architects, engineers, and building contractors. Architectural 3D modeling tools from Autodesk incorporate a range of features to assist in 3D design and architectural visualization. Autodesk Architecture is currently sold as a subscription-based product. 2010 redesign On April 15, 2010, Autodesk announced the redesign of AutoCAD, AutoCAD LT, AutoCAD Architecture, AutoCAD Dynamo, and Intergraph's Building Information Modeling products. This redesign makes use of the same "synergies" as the larger DesignCenter family of products. In 2012, Autodesk announced a new version of AutoCAD, AutoCAD 2013, with a complete redesign. The new interface has been reworked to be more intuitive, smoother, and responsive, along with incorporating many new features. In 2017, Autodesk announced a new version of AutoCAD for Windows, AutoCAD LT, which is a full implementation of the company's unified platform. The current version is AutoCAD 2018. Features 3D AutoCAD is marketed primarily as a 3D drawing application. The interface is the same in 2D and 3D, with similar features for placing objects and creating 2D layouts. It has a 3D modeling environment, and it supports multiple users, with the ability to share models, and the ability to connect to AutoCAD R12 (or later) and AutoCAD LT files using DXF (DWG) interchange format. Graphic interface AutoCAD, AutoCAD LT, and AutoCAD Architecture use an interface similar to that of the discontinued Alias System Architect, with a simple interface that uses top-down design workflows and a 2D interface to create 2D drawings. The interface is based on the Graphic Desktop Environment. The legacy menu and dialog boxes were adopted into the new interface, and the look was updated to use a tabbed interface. Construction and mechanical drafting AutoCAD is a mechanical drafting application, suitable for drafting blueprints, wiring diagrams, piping and piping drawings, and electrical and lighting designs. It has tools to perform basic mathematical operations, such as dimensioning and splicing. The interface is similar to the previous version (AutoCAD LT 2002) and is similar to that of the discontinued Alias System Architect product a1d647c40b
