Recently, French computer security expert and malware researcher Remy Lebeau published a research paper (warning: PDF) on security architecture in Microsoft Windows Vista and Windows 7. The paper is now available online in a summary form (pdf). Remy was then kind enough to reply to my email to clarify some questions and give us a few interesting details about this research. In a telephone interview, Remy explained what the paper will do for you. He also mentioned his opinion about the security concept behind Windows 7. Securosis: Could you briefly explain the reason for publishing this research paper? Remy: I published the research paper because I found interesting the way Windows Vista and Windows 7 were architected. I like to know how the system works and what are the main points to avoid security problems. That's why I took the chance to analyze in details the security architecture in Windows Vista and Windows 7. What do you want people to understand from the paper? Remy: The paper will show that some features introduced in Windows Vista and Windows 7 are unsecure. Many of the changes introduced in these operating systems are aimed at providing a better user experience but they bring only risks, not guarantees. The article also shows that the security concept behind Windows Vista and Windows 7 is not the one I proposed in 2005. Remy: Yes, that is what the research paper shows. What is the philosophy behind your idea of architecture in this paper? Remy: The paper presents the security concepts I introduced in 2005: zones, security context, cryptography. The concept of security zones emerged when I observed that several mechanisms of Windows Vista and Windows 7 are unsecure. An obvious example is the protection mechanism of the new Windows 7 media player which copies the media keys used for DRM protection into the global zone. So, a malicious user can
